Optimal control
 by microprocessor
All year round operation

USE

The new range **AQUACIAT** offers a solution to both heating and cooling applications encountered in the public, tertiary or industrial process fields.

Its remarkable acoustic characteristics, its microprocessor integral control and the large range of versions make this unit suitable to any application.

All the components are mounted on a steel frame with **large dismountable panels to ease maintenance operations.**

This line of products exists in 6 versions :

AQUACIAT LD

COOLING ALONE operation

AQUACIAT LDH

COOLING ALONE operation + hydraulic module

AQUACIAT LDC

COOLING ALONE operation + pumping unit.

AQUACIAT ILD

REVERSIBLE HEATING or COOLING operation

AQUACIAT ILDH

REVERSIBLE HEATING or COOLING operation + hydraulic module

The whole range integrates the last technological innovations and meets following expectations :

- **Silence,**
- **Respect of environment,**
- **Simplicity of installation and reliability.**

(1) Cooling capacity and power input (without pump) for a +7 °C chilled water outlet and a 35 °C air inlet.

(2) Heating capacity and power input (without pump) for a +45°C hot water outlet with the same water flow as the cooling mode and a +7°C DB RH air inlet.
Exchange fouling factor : 0,000044 m²C/W

DESCRIPTION

AQUACIAT LD

■ Unit conforms to EN 60-204 - EN 378-2 norms and to following directives :

- 98 / 37 CEE

- CEM 89 / 336 CEE modified 92/31 CEE 93/68 CEE

Low voltage 73/23 CEE modified 93/68 CEE

- DESP 97 / 23 CEE -> group 2

■ Scroll hermetic compressor(s)

■ Motor cooled by suction gas

■ Internal motor protection by winding sensor

■ Mounted on resilient mounts

■ Brazed plates evaporator

■ End and internal plates made of AISI 316 stainless steel, with high performance optimized pattern.

■ Thermal insulation

■ Air cooled condenser

■ Copper pipes and mechanically bonded aluminium fins coils

■ Direct drive propeller fan(s) 500 or 750 rpm (standard wiring: 500 rpm)

■ **2 speed motor - IP 55, Class F**

■ Coil protection grille (models 100 to 750

0)

■ Control and safety devices

■ HP safety by manual reset pressostats

■ LP safety :

- by automatic pressostats models ILD 200 to 600

- by pressure pick-up and electronic regulator (other models)

■ Water flow controller mounted

■ Condensing pressure regulation allowing an operation down to - 15°C outside :

- by automatic HP pressostats (models ILD 100 to 600)

- by pressure pick-up and electronic regulator (other models)

■ Evaporator anti-frost protection :

- by trace heating element

- by room heaters models 753 to 1000

■ Control panel

■ Main safety switch with external handle

■ Remote circuit transformer

■ Remote control and power circuits protection

■ Contactors and compressor(s) fan(s) motors protection

■ Wiring numbering

■ **Microprocessor electronic module ensuring the following main functions**

- chilled water temperature control (on evaporator return or departure) or a function of the outside temperature.

- operating parameters control

- faults diagnosis

- automatic equalization of compressors running hours

- remote management and remote survey

- **RS 485** exit for BUS control

- HP and LP pressure pick up for manometers.

AQUACIAT LDH

The basic composition of the **AQUACIAT LDH** water chillers is identical to the AQUACIAT LD

These derived units integrate a **complete hydraulic module** based on a traditional installation :

- 1 buffer tank in black sheet metal, with thermal insulation.
- 1 monocellular centrifugal hydraulic pump (single or double pump).(1)
- 1 expansion vessel
- 1 automatic air vent
- 1 safety valve
- 1 filling hole with valves
- 1 draining hole with valve
- 1 set of manometers
- Contactor(s) and protection device(s) for the hydraulic pump.
- **Hydraulic circuit antifreeze protection through electrical heaters and thermostat (all models) + tank protection by immersion heater (753 to 1000)**
- 1 strainer
- 1 balancing valve (models 100 to 750)

AQUACIAT LDC

The basic composition of the **AQUACIAT LDC** water chillers is identical to the one of the AQUACIAT LD

These derived units integrate the **pumping unit** :

- 1 monocellular centrifugal hydraulic pump (single or double pump).(1)
- 1 expansion vessel
- 1 automatic air vent
- 1 safety valve
- 1 filling hole with valves
- 1 draining hole with valve
- 1 set of manometers
- Contactor(s) and protection device(s) for the hydraulic pump.
- **Hydraulic circuit antifreeze protection**
- 1 strainer
- 1 balancing valve (models 100 to 600)

AQUACIAT serie ILD

The **AQUACIAT ILD** allows, by reversing the thermodynamic cycle, a production of chilled or hot water, depending on the season. Associated with the CIAT terminal units (fan coils, cassettes, air handling units), they offer a maximum comfort and high performances all year around.

AQUACIAT ILDH

The basic composition of **AQUACIAT** units **ILDH** is identical to the one of the AQUACIAT ILD, plus the **hydraulic module**.

IMPORTANT

Each can be equipped with brazed plates **desuperheater(s)** to permanently recover part of the heat for hot water production. This option is particularly suitable for installations operating all year around and **guarantees important energy savings**.

OPTIONS

- Antivibration equipment :
 - hydraulic flexible connections kit
 - High and low pressure gauge panel (ILD - ILDH) 200 to 600
 - Coil protection grille
 - Coil treatment :
 - Polyurethane coated fins
 - Blygold Polual treatment
 - Remote control
 - Dry contacts relay card
 - Variable speed
 - Supply voltage 230 V - 3 ph - 50 Hz
 - Brazed plates desuperheater(s) (Except LDC version)
- (1) Our pumps are designed for operation on a close water loop (low NPSH). For other applications, consult us (open water circuit, important intake height, etc).

OPERATING LIMITS

Chilled water production	LD - LDC - LDH
Outside ambient temperature	
°C maxi with full load	
Fans 500 rpm	+40 °C (44 °C -> 753 à 1000)
Fans 750 rpm	+44 °C
Mini °C	-15 °C
Evaporator	
ΔT mini °C	see curves below
ΔT maxi °C	
Hot water production	ILD - ILDH
Outside ambient temperature	
Maxi wet bulb temp °C	+15 °C
Mini wet bulb temp °C	-10 °C
Condenser	
Hot water outlet temperature °C	+50 °C
ΔT mini °C	5 °C
ΔT maxi °C	10 °C

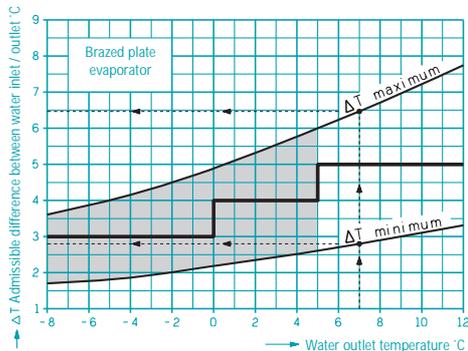

LD - LDC - LDH 100Z to 1000Z

Evaporator

The curves below represent the minimum and maximum temperature differences admissible on the chilled or glycolated water, as a function of the outlet temperature.

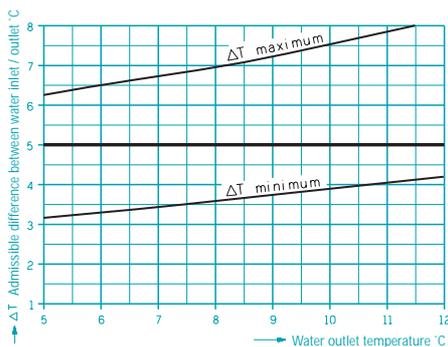

LD - LDC - LDH 100 to 1000

— Performance tables calculations ΔT
 shaded area glycol water

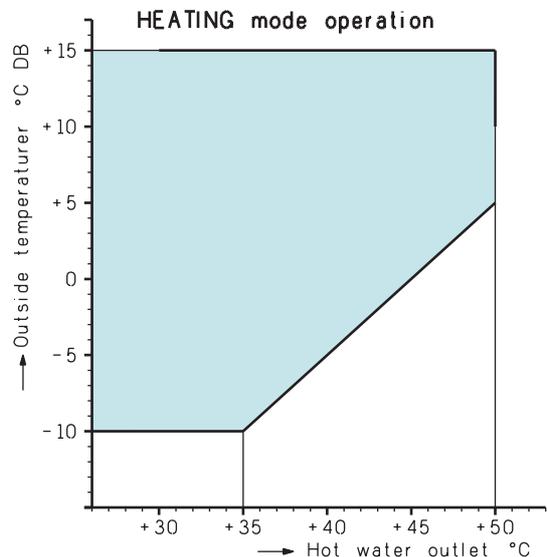

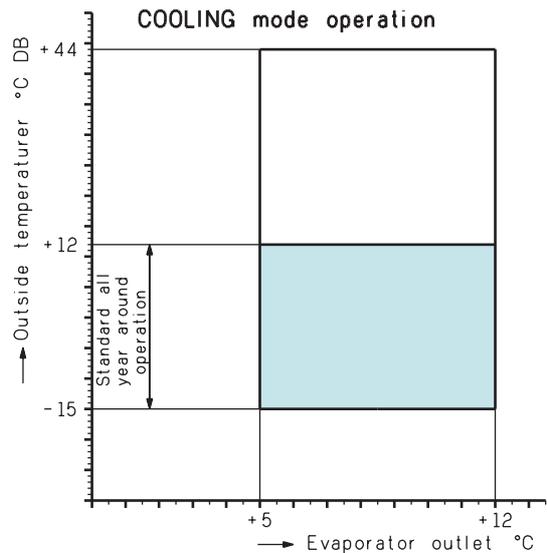

Example : for a water outlet : + 7 °C
 ΔT minimum : 2,8 °C / water temp : 9,8 / 7 °C
 ΔT maximum : 6,5 °C / water temp : 13,5 / 7 °C
 For temperature differences not included between the two curves, consult us.

ILD - ILDH 200 to 1000

— Performance tables calculations ΔT

ILD - ILDH 100Z to 1000Z

GLYCOL WATER COEFFICIENT

- 30 % concentration by glycol weight
- Freezing point of the solution : - 17.5 °C

CORRECTION		POSITIVE CONDITIONS		NEGATIVE CONDITIONS	
		K	Calculation mode	K	Calculation mode
Evaporator	Cooling capacity	0,98	$P_{fc} = P_f \times 0,98$	1,00	See selection table
	Chilled water flow	1,05	$Q_c = P_{fc} \times 0,86 \times 1,05$	1,10	$Q_c = P_{fc} \times 0,86 \times 1,10$
	Water pressure	1,15	$\Delta P_c = \Delta P \times 1,15$	1,30	$\Delta P_c = \Delta P \times 1,30$
	Average temp.	12 / 7 ° C		See table	
Condenser	Cooling capacity	0,97	$P_{fc} = P_f \times 0,97$		
	Chilled water flow	1,05	$Q_c = (P_{fc} + P_a) \times 0,86 \times 1,10$		
	Water pressure	1,10	$\Delta P_c = \Delta P \times 1,10$		
	Average temp.	35 / 40 ° C			

K : Correction coefficient
Values written in the brochure :
P_f : cooling capacity as per selection table
P_a : compressors power input as per selection tables
ΔP : water pressure drop as per curves, for the corresponding corrected flow value (Q_c)

Values corrected as per above calculations :
P_{fc} : corrected cooling capacity
Q_c : corrected flow, chilled or hot water
ΔP_c : corrected water pressure drop, evaporator or condenser

PROPELLER
CONDENSER

MINIMUM WATER VOLUME

- LD - LDC - LDH / ILD - ILDH

The Connect control is equipped with an anticipation logic allowing high flexibility in adjusting the set points according to the parameters drifting, in particular for low water volume hydraulic installations.

An adapted management of the compressors operating periods avoids therefore the start of anti-short cycle functions, and in most cases, the requirement of a buffer tank.

Models LD - ILD - LDC	100	150	200	250	300	350	400	450	500	600	750	753	900	1000
Minimum volume Of installation	112	181	110	112	174	121	174	167	106	164	161	327	257	322

Remark :

Industrial processes which require high stability of water temperatures or installations with high thermal load variation can privilege the use of LDH-ILDH models equipped with a buffer tank.

Reversible AQUACIAT ILD - ILDH

The reversibility on one single unit offers an appreciable economical advantage :

■ **In winter** : thanks to their high coefficient of performance (COP), the reversible AQUACIAT units offer a low and controlled heating cost. Designed for extreme conditions, the AQUACIAT can operate down to - 15 °C outside temperature. The reverse cycle represents substantial savings, up to 50 % compared to a traditional heating device.

■ **In summer** : the same unit allows cooling at a lower cost.

AQUACIAT ILDH

Monobloc design, tested in factory and fitted with all the accessories required by an hydraulic circuit (buffer tank, expansion vessel, circulation pump...), the installation of reversible AQUACIAT, ILDH with hydraulic module heater is simple, quick and at a low cost.

These compact units save a lot of space in the plant room (pumps, tanks integrated).

* 230 V - 3 ph : Controlled voltage in France

Total intensity of unit : sum of the max. nominal intensities mentioned in the above tables.

SOUND LEVELS

The AQUACIAT LD(C / H) and ILD (H) range is strictly designed to combine the "noiseless" assembly techniques for attenuation of vibrations and sound sources.

- SCROLL compressor(s) located outside the air flow ①.
- Anti-vibration mounting of several compressors on a structure isolated from the frame ②.
- Pipework independent from the unit structure.
- Low speed fans (500 rpm) LOW NOISE ③.
- Antivibratil mounts supplied as standard Æ ④.

PROPELLER
CONDENSER

- Acoustic pressure levels ref 2×10^{-5} Pa ± 3 dB

Measurement conditions :

- Compressor(s) + fan(s) at low speed (500 rpm) LOW NOISE
- Free field
- 10 m distance from the unit, 1.50 m from the ground
- Directivity 2

AQUACIAT	PRESSURE LEVEL SPECTRUM (dB)							Total level dB(A)
	63 Hz	125 Hz	250 Hz	500 Hz	1000 Hz	2000 Hz	4000 Hz	
100	63	54	47	47	43	40	34	48

The AQUACIAT installation is very easy, this unit being equipped with an hydraulic pack whose components are selected in an optimal way, mounted and tested in factory, The design of components, supplies, connections is no longer necessary..

Delivered fully equipped, the AQUACIAT is ready to operate.

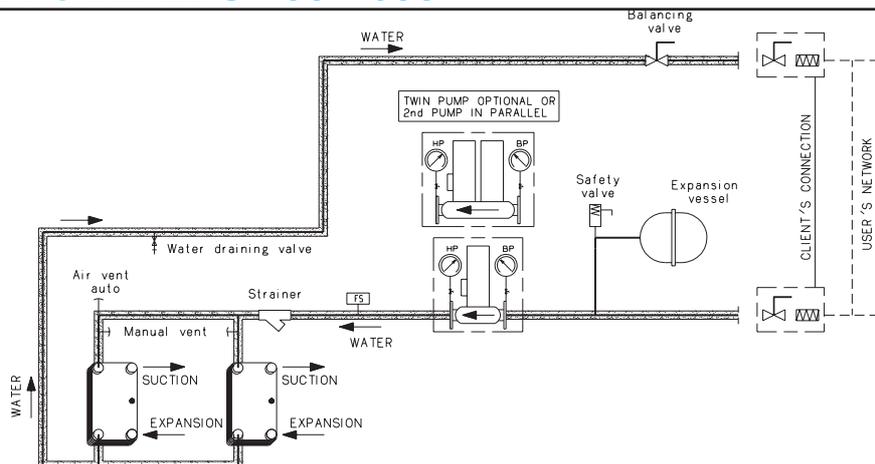

In short, the AQUACIAT hydraulic pack optimizes the preparation and operation time and the required.space.

Connecting, cooling ... ; with AQUACIAT everything becomes simple and economical.

INSTALLATION RECOMMENDATIONS

AQUACIAT serie LD - LDC - LDH - ILD - ILDH

■ Location :

The instructions given in the Installation, Operation, Commissioning and Maintenance manual must be respected.

The **AQUACIAT** units must be positioned outside a plant room, sheltered from adverse weather and frost, in conformity with the regulations existing in the country of installation.

Piping must be protected from frost

- Leave a free space all around the unit to allow access to the control panel and technical compartments and to ensure a correct air flow.
- Possible harmful effects due to noise are to be carefully studied.

Therefore, before positioning, study and treat the various possible noise transmissions ; The assistance of an acoustic specialist may be usefull.

- The unit must be levelled on resilient mounts.
- If required, fit the pipework with rubber expansion joints (optional)

■ Operations to be carried out before lifting the unit :

Follow the recommendations affixed on the machine or the instructions in the Installation, Operation, Commissioning and Maintenance manual.

■ . Mounting of the accessories delivered separately :

The instructions in the Installation, Operation, Commissioning and Maintenance manual must be respected.

Several accessories, delivered separately, can be mounted on the unit on site.

■ Electrical wiring :

The instructions in the Installation, Operation, Commissioning and Maintenance manual must be respected.

- All necessary instructions for electrical connections are detailed on the wiring diagrams enclosed with the unit. They must be strictly followed.
- These connections must be made in accordance with good engineering practice and must conform to regulations in force.
 - . Main three phase electric power supply
 - . Earth connection
 - . Single phase electrical supply to the control box (depending on the models)
 - . Remote control of the machine or volt free contact signals (optional)
- It is important to note that the chiller has no lightning protection
- Therefore, adequate protective devices against these transient phenomena must be planned and integrated on the electrical supply on site.
- The machine must always be live to ensure the internal frost protection

■ Piping connections :

The instructions in the Installation, Operation, Commissioning and Maintenance manual must be respected.

All pipes must be correctly aligned and sloped toward the drain valve to permit complete drainage of the system. Pipes must be installed and connected to the machine, making sure that there is a free access to the panels.... Thermal insulation must be provided.

- Pipes supports and fixations must be independant to avoid vibration and strains on the unit
- On-site connections required (evaporator, discharge and draining)
- Provide the accessories necessary for all hydraulic circuits, for example :
 - water expansion vessel,
 - drain valves on lower points of pipes for water drainage
 - circuit isolating valves and filters
 - air vents on upper points of pipes
 - check that there is a sufficient water volume in the installation (if necessary, provide a storage tank)
 - manual valve to adjust the water flow
 - thermometers at each inlet and outlet connection for measurement necessary during commissioning and maintenance operations

Caution :

- Water circuit pressure must not exceed 4 bar
- Expansion vessel mounted before the water pump
- Do not install any valve on the expansion vessel
- Make sure to install the water circulating pump immediately on the exchanger water inlet side
- Make sure that the water pressure at the circulating pump suction is equal to or higher than the minimum pressure NPSH required, particularly in case of an " open " type circuit
- The water quality criteria have to be analysed.
- Frost protection devices are required for the machine and hydraulic installation, in particular draining possibility of the circuit.
- In case of glycol being used against frost, check its physical properties and concentration before starting the unit
- Before carrying out the final hydraulic connections, the pipes must be flushed with clean water to remove possible debris.

■ **Commissioning**

WARNING :

A water filter (600 microns) must be mounted on the unit inlet by the installer. Isolating valves and manual valves for water flow adjustment must also be installed.

Follow the instructions in the Installation, Operation, Commissioning and Maintenance manual.

The commissioning of the AQUACIAT units must be carried out by CIAT or a company agreed by CIAT

Non exhaustive list of operations to be carried out during commissioning :

- Check the correct location of the machine
- Verification of the electrical supply protection
- Verification of the phases and correct rotation direction
- Verification of the electrical connections on the unit
- Verification of the correct sense of water circulation on the unit
- Verification of the water circuit cleanliness
- Water flow adjustment to the specified value
- Verification of the refrigeration circuit pressures
- Verification of the correct compressors rotation direction
- Verification of the water pressure drops and water flows
- Completion of running parameters check list

■ **Maintenance operations and Warranty**

Comply with the instructions in the Installation, Operation, Commissioning and Maintenance manual.

The AQUACIAT chillers require specific routine maintenance operations which must be carried out by CIAT authorized Companies.

A report of the running parameters must be completed on the " check list " form and returned to CIAT

It is necessary to take out a maintenance contract for the unit with a specialist on refrigeration machines agreed by CIAT, even for the warranty period.

RÉGULATION CONNECT

ERGONOMIC INTERFACE PANEL

- LCD multilingual screen (2 lines of 20 characters)
- Pressures and temperatures reading
- Pump control
- Communication

Available free contacts inputs / outputs

- Inputs :*
- External ON/OFF contact
 - Setpoint 1/2 selection
 - Cooling / heating selection
 - Compressors load shedding

- Outputs :*
- General fault of the unit

RS 485 OUTPUT IN STANDARD

MODBUS-JBUS open Protocol

FREE CONTACTS RELAY CARD (OPTION)

- Available outputs :*
- Water flow fault
 - Antifreeze fault
 - Pump fault
 - Fans fault
 - Low and high pressure fault
 - Compressors safety fault
 - Discharge temperature fault
 - Compressors running status

REMOTE CONTROL BOX (OPTION)

Identical to the ergonomic interface
